

FGL Anti-Slip Glazing

Laser processing is a cutting-edge technique that has revolutionized the way slip resistance is achieved on various surfaces.

Unlike traditional methods such as screen printing or sandblasting, laser processing offers a level of transparency that does not compromise the aesthetic appeal of the material. Its resistance to abrasion is unparalleled, ensuring longevity and durability. Moreover, the ease of cleaning and reduced sensitivity to dirt accumulation make it a superior choice for applications where cleanliness and clarity are paramount.

This technology provides a fine balance between functional efficiency and visual quality, making it an ideal solution for modern material processing needs.
